The Production Tracking Management System (PTMS) concept from SFK is a complete PC-based tracking and controlling system that ensures precise overview and control throughout production – from the arrival of animals at the slaughterhouse, through all phases of production to final dispatch in consumer packs or bulk cartons.

It is possible to track products through the process from consumer back to producer and further back to farmer.

With PTMS, SFK offers a total concept consisting of tailor-made production equipment and production information systems, increasing both process efficiency and return on investment.

This advanced system of electronic scales, PC terminals, printers, scanners, transponder systems, and software makes it possible to control and optimize production and to maximize profits through tracking and controlling.

Logistics and packing

SFK's logistics and packing solutions ensure flexible and efficient handling and packing of meat, enabling the meat industry to respond to changing demands. Health and safety standards are among the best in the world.

- Film wrapping
- Bulk packing and weighing into lined trays
- Sorting out into bins
- Automatic cartons transport
- Semi- and fully automatic palletizing
