

## Copy of some advice to a potential BOLIVAR Client

WHITE TRIPE or not ? This is the next question

If you want white tripe then you need to use H<sub>2</sub>O<sub>2</sub> (Hydrogen Peroxide) as a whitening agent. It works brilliantly and you can get an absolutely white end product that some clients like very much, but this depends on the market involved. I am also attaching some documents that you may find helpful in this regard.

I do not in any way consider myself an expert on the above issue, but nevertheless have a good understanding of the problems involved. This advice is given to you in good faith and **not** from an expert point of view.

*In general my advice would be as follows:*

You need two separate tanks to complement the BOLIVAR P-105V-- the first one should have the H<sub>2</sub>O<sub>2</sub> solution inside and the second one must have cold, clean water for rinsing.

- Start with the standard 35% H<sub>2</sub>O<sub>2</sub> solution and look at the end product after a while. It should be really excellent after leaving it in this solution for some time and then it must be washed with clean cold water and then finished in a second lot of cold clean water.
- Normally the water in these tanks should be slightly overflowing all the time, with a constant supply of fresh water to the tanks. Take some digital photos and WRITE down all the steps you have taken during the process, otherwise after three or four tests you will never remember which combination gave you the best results. I know this from bitter experience !
- Next step is to start to reduce the H<sub>2</sub>O<sub>2</sub> concentration in say, steps of 10%, and again watch, photograph and WRITE down the parameters you used and the results.
- Settle on the LOWEST concentration H<sub>2</sub>O<sub>2</sub> mix that you consider gives you the best and most consistent results.
- Remember, you have to have both **repeatability** and **consistency** of results, otherwise you will have problems with your customer.
- As I told you earlier there is no “magic bullet” I can give you. You must make a lot of trials and then settle on something that the operators can easily understand and more importantly, implement.
- You do NOT have Rocket Scientists to work with and this must be borne in mind.
- From the time the Stomach is first opened you need to have a definite method from that point to the end of the entire process and this needs to be written down for the operators and must also be used to monitor their performance every day.
- Management must know **all** the steps, **all** the time.
